Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

1. Purpose and Scope

In addition to determining compliance of the operation, DA 470-11-2003 Schedule 5 Condition 9 (S5.C9) requires that the AR reports on specific components of the operation.

S5.C9 and all other relevant conditions required to be addressed as part of the AR are outlined in Table 2 with reference to the section of this report where each has been addressed. The timeframe for the annual review is the 2019 Financial Year which is 1 July 2018 – 30 June 2019.

Table 2 Relevant Conditions relating to the Annual Review

| Condition of Approval | Condition Requirements | Location within this report |
|-----------------------|--|---|
| S5.C9 | <p>By the end of September each year, or other timing as may be agreed by the Secretary, the Applicant must submit a report to the Department reviewing the environmental performance of the development to the satisfaction of the Secretary. The review must:</p> <ol style="list-style-type: none"> a) Describe the development (including rehabilitation) that was carried out in the previous financial year, and the development that is proposed to be carried out over the current financial year; b) Include a comprehensive review of the monitoring results and complaints records of the development over the previous financial year, which includes a comparison of these results against the: <ul style="list-style-type: none"> • Relevant statutory requirements, limits or performance measures/criteria; • Requirements of any plan or program required under this consent; • Monitor results of previous years; and • Relevant predictions in the document listed in condition 2 of schedule 3; c) Identify any non-compliance over the last financial year, and describe what actions were (or are being) taken to ensure compliance; d) Identify any trends in the monitoring data over the life of the development; e) Identify any discrepancies between the predicted and actual impacts of the development, and analyse the potential cause of any significant discrepancies; and f) Describe what measures will be implemented over the current financial year to improve the environmental performance of the development. <p>The Applicant must ensure that copies of the Annual Review are submitted to Council and are available to the Community Consultative Committee (see condition 6 of Schedule 5) and any interested person upon request.</p> | <p>Section 5.7</p> <p>Section 5</p> <p>Section 7</p> <p>Section 5</p> <p>Section 5</p> <p>Section 8</p> |
| S4.C29 | <p>In each Annual Review, the Applicant must:</p> <ol style="list-style-type: none"> a) Recalculate the site water balance for the development; and b) Provide information on evaporative losses, dust suppression, dam storage levels and implications of obtaining any water supplies from off-site; and c) Evaluate water take against licencing requirements. | Section 5.5.3 |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

| | | |
|--------|---|--|
| S4.C51 | The Applicant must include a progress report on the implementation of the Flora and Fauna Management Plan in the Annual Review. | Section 5.7 and Appendix G |
| S4.C58 | The Applicant must include a progress report on the Rehabilitation Management Plan in the Annual Review. | Section 5.7 |
| S4.C72 | The Applicant must describe what measures have been implemented to minimise the amount of waste generated by the development in the Annual Review. | Section 5.9 |
| S4.C78 | The Applicant must: (a) provide annual production data to the DRE using the standard form for that purpose; and (b) include a copy of this data in the Annual Review. | (Provided to the DRE) Section 3.4 |

Copies of the AR will be submitted to the DPIE and made available to the public at on the Dunmore Quarry website.

<https://www.boral.com.au/locations/boral-dunmore-operations>

Key contacts associated with the management of the Quarry operations, environment, safety and stakeholder relationships are provided in Table 3.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

2. Introduction

The Dunmore Hard Rock Quarry, owned and operated by Boral Resources (NSW) Pty Ltd, is located at Tabbita Road Dunmore, approximately 12 kilometres north-west of Kiama in the Shellharbour Local Government Area. The Quarry produces hard rock from Bumbo Latite Member, a fine-grained intermediate volcanic rock similar to basalt, which is crushed to produce coarse aggregates, road construction materials and fines.

Development Consent (DA 470-11-2003), issued 19 November 2004 by the Minister for Infrastructure and Planning, allows Boral to produce up to 2.5 million tonnes of quarry product a calendar year (Mtpa), and transport it offsite by road and rail to local and regional markets.

Dunmore Hard Rock Quarry (the site) covers approximately 248 hectares and is surrounded by private property, predominantly agricultural grazing land and tracts of remnant native vegetation, to the south, north and west (The Boral owned and operated Dunmore Lakes Sand Project adjoins the site to the east).

The extraction method involves drilling and blasting to produce broken rock, that is transported to the primary crusher feed bin. The primary-crushed rock is further reduced in size in a series of crushers, before being conveyed to the tertiary screen house where the crushed rock is sized according to product specifications. The sized products are then stockpiled within the various stockpile areas on site, until they are transported to local and regional markets.

During the reporting period extraction has occurred in the area known as the Croome West Pit. Approval of the most recent modification, MOD 11 was granted in March 2019.

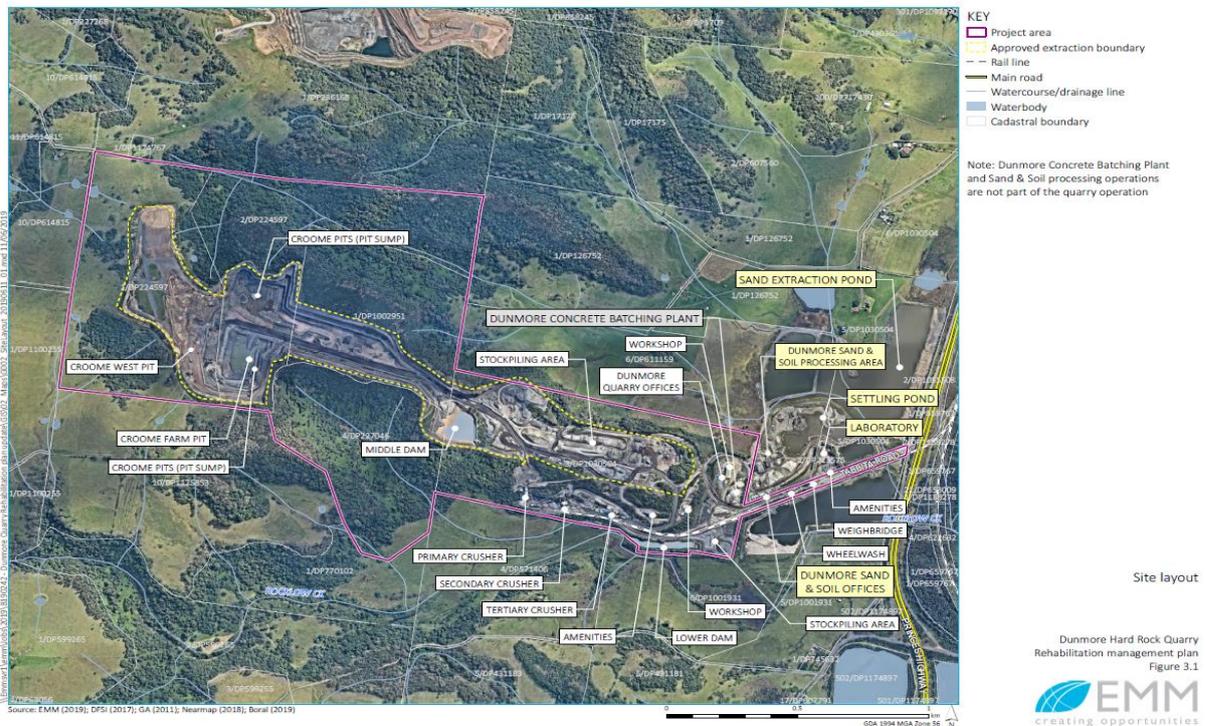

Figure 1: Dunmore Quarry Site Layout

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

2.1. Approvals

Dunmore Quarry operates under a number of regulatory approvals and licences which are summarised in Table 4 below.

Table 4: List of Relevant Approvals for Dunmore Quarry

| Approval | Detail | Regulatory Authority |
|---|---|--|
| DA 470-11-2003 Modification 11 | Quarry operating conditions as granted by DPIE. The current consent has been updated to remove the restriction of road transport within this reporting period. The current modification (MOD 11) was granted in March 2019. | NSW Department of Industry, Planning and Environment |
| EPL 77 | The EPL is issued for the scheduled activity of: Crushing, Grinding, Separation and Extractive activities for tonnages up to 2 million tonnes per annum as defined by the EPA anniversary date 31 August. | NSW Environmental Protection Authority |
| Water Access Licence WAL#25152 Ref# 10AL103610 | Extraction of water from the Lower Dam. This allows for 227ML per annum to be extracted from Rocklow Creek. Since 2008 the Lower Dam has been taken offline from Rocklow Creek as part of MOD 2 | NSW Office of Water |

A copy of DA 470-11-2003 and EPL77 is available on request or can be accessed through the Boral Dunmore website:

<https://www.boral.com.au/locations/boral-dunmore-operations>

3. Quarry Operations

3.1. Operations the last 12 months

Extraction has continued in the Croome West Pit moving primarily straight down the face of to minimise noise and dust impacts. Extraction is moving slowly north-west. Overburden placement has occurred in the northern section of the formerly mined Croome pit. Production for the last financial year was approximately 2,028,544 tonnes with the majority of that production servicing Sydney / Illawarra area.

The blending plant approved as part of MOD 7 begun construction with completion expected within the next reporting period. The tertiary screen house was re-cladded as part of regular maintenance works.

3.2. Operations in the next 12 months

During FY20, production will continue with the Croome West Pit moving gradually north-west and down the existing face.

3.3. Modifications Approved in the Last 12 months.

Under conditions of its Development Consent (DA 470-11-2003), the quarry is approved to produce 2.5 million tonnes per annum (Mtpa) and transport by road or rail. Due to the volume of aggregate

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

required to supply Sydney infrastructure projects and maximised production at Peppertree Quarry, there is limited additional Boral terminal capacity in Sydney available for Dunmore Quarry trains.

Accordingly, MOD 11 was sought to remove the restriction on road transport which had previously been capped at 1.5 Mtpa. This modification was approved in 15 March 2019.

During the reporting period the DPIE has approved the following management plans

Biodiversity Offset Strategy (part of FFMP) – approved 21/5/19

- Air Quality Management Plan – approved 21/5/19
- Blast Management Plan – approved 19/6/19
- Flora and Fauna Management Plan – approved 19/6/19

The following management plans have been submitted to DPIE and Boral is awaiting feedback

- Rehabilitation Management Plan – submitted 14/6/19
- Water Management Plan – submitted 14/6/19

The following management plans were reviewed and assessed that no changes were required to satisfy MOD 11 requirements

- Bushfire Management Plan
- Noise Management Plan

3.4. Production and Sales and Transport Last 12 months

Calendar year production data is shown below in Table 5. Financial Year production data is shown in Table 6.

Table 5 Calendar Year Production Data

| Month | Production (t) | Sales (t) | |
|--------------|------------------|------------------|----------------|
| | | Road | Transfers |
| Jan-2018 | 127,617 | 101,572 | 8,872 |

| Nov-2018 | 169,348 | 161,984 | 8,461 |
| Dec-2018 | 103,822 | 114,297 | 1,265 |
| Total | 2,028,544 | 1,679,500 | 154,437 |
| | | 1,833,937 | |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

Table 6 FY19 Production Data

| Month | Production (t) | Sales (t) | |
|------------------------------------|----------------|-----------|-----------|
| | | Road | Transfers |
| Jul-2018 | 182,198 | 149,137 | 15,695 |
| Aug-2018 | 199,206 | 157,559 | 12,595 |
| Sep-2018 | 176,065 | 165,504 | 7,269 |
| Oct-2018 | 142,028 | 173,110 | 7,198 |
| Nov-2018 | 169,348 | 161,984 | 8,461 |
| Dec-2018 | 103,822 | 114,297 | 1,265 |
| Jan-2019 | 165,472 | 105,088 | 10,298 |
| Feb-2019 | 171,887 | 136,540 | 14,488 |
| Mar-2019 | 150,849 | 127,759 | 21,166 |
| Apr-2019 | 116,324 | 103,425 | 9,133 |
| May-2019 | 142,810 | 185,458 | 15,587 |
| Jun-2019 | 153,975 | 160,167 | 9,873 |
| Total up to MOD 11 approval | 1,310,026 | 1,163,219 | 77,269 |
| | | 1,240,488 | |
| FY 19 Total | 1,873,984 | 1,740,028 | 133,028 |
| | | 1,873,056 | |

As discussed in Section 3.1, the restriction of road transport was removed as part of MOD 11 approval in 15 March 2019. The production figures for FY19 were below the consent limits of 2.5 Mtpa for the current reporting period.

Future reporting of production data in subsequent AR will be in FY format for consistency with requirements to report in the DRG format. A summary of the production reported to the DRG format is shown in Table 7.

Table 7 Production Data DRG Format

| Product | Type of Material | Total Sales / Disposals | |
|-------------------------------|------------------|-------------------------|-------------------|
| | | Quantity (Tonnes) | \$ Value of Sale* |
| Virgin Materials | | | |
| Crushed Coarse Aggregates | | | |
| Over 75mm | Latite | 60,833 | * |
| Over 30mm to 75mm | Latite | 30,901 | * |
| 5mm to 30mm | Latite | 1,000,209 | * |
| Under 5mm | Latite | 197,602** | * |
| Natural sand | Latite | | * |
| Manufactured Sand | Latite | | * |
| Prepared Road Base & Sub Base | Latite | 436,873 | * |
| Other Unprocessed Materials | Latite | | * |
| Total | | 1,739,875 | * |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

Note: This data is an approximation of FY19 production data and is subject to change.

**This information is commercially sensitive and has been omitted.*

*** This product is not part of the total sales*

3.5. Production, Sales and Transport next 12 months

Production has been forecasted to be below FY19 numbers for the upcoming FY20 reporting period to the Sydney market with a slight increase in local infrastructure works in the Illawarra. Predicted production tonnage is approximately 1.2 to 1.6 Mt however production will be set to market demand which may fluctuate over the next 12 months. A new docketing and weighbridge system has been introduced business wide at Boral in July 2019 (outside of this reporting period).

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

4. Actions Required From the Previous Annual Review

Table 8 lists specific actions arising from the previous Annual Review.

Table 8 Actions Required From 2017-18 Annual Review

| Proposed Activities from FY18 AR | Status | Where discussed |
|---|--|---|
| Finalise suite of management plans for MOD 8 and 9 operations. | A suite of management plans were approved post MOD11 and Boral is still awaiting feedback from DPIE for the Rehabilitation Management Plan and Water Management Plan | Section 3.3 |
| Finalise offset approach with DPE regarding offset arrangements for Mod 8 and 9 via the Biodiversity Offset Strategy (BOS). | BOS was approved in May, payment into the BCT will be undertaken in the next reporting period. | Section 5.7 |
| Addition primary weed control within all zones to link fragmented remnants and provide assistance for natural regeneration. | Goodbush has undertaken primary weed control in required zones. | Appendix G details the outcomes of the primary and secondary weed control works |
| Continued secondary weed control throughout all previously worked area to assist plant establishment and regeneration | Goodbush has undertaken secondary weed control in required zones. | As above |
| Maintenance of the fencing around zone | Repairs have been made to fence lines around the Compensatory Habitat Area. Despite this cattle are still gaining access through some fences. Further fence repairs will continue in the next reporting period and education for tenanted owners will be undertaken to reduce cattle intrusion. | Section 5.7.2 |
| Install controls to prevent dumping throughout Rocklow Rd | Signage had been installed around access roads to deter dumping. Despite these measures dumping is still prevalent. The installation of cameras will have to be undertaken during the next reporting period. | Section 5.7.3 and Section 5.7.4 |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

| | | |
|--|--|---------------|
| | Controls will be continue to be monitored for effectiveness. | |
| Hydro-seed the northern section of the Croome West Amenity Bund | <p>Hydro-seeding was undertaken in November 2018 and April 2019. More hydro-seeding works have been scheduled for spring 2019.</p> <p>A contract for maintenance work is currently being devised with bush regeneration contractors.</p> | Section 5.7.2 |
| Upgrade the water management system of the site and upgrade the Lower Dam pending the approval of the WMP. | <p>As per condition S4.C35A improvement works cannot begin until the Lower Dam Transition Plan (sub-plan attached to WMP) is approved.</p> <p>In the interim the water management system will continue to run as per the approved Water Management Plan (Arcadis 2016).</p> <p>Consultation with EPA and DPIE will continue in regards to the approval of the WMP.</p> | Section 5.5.5 |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5. Environmental Performance

Dunmore Quarry has comprehensive management and monitoring programs which collect information and data for the assessment of environmental impacts, regulatory compliance and performance against continual improvement objectives. Specific Management Plans define the framework for measuring environmental performance and compliance with statutory requirements for each relevant aspect of environmental performance and are available on the Dunmore website.

<https://www.boral.com.au/locations/boral-dunmore-operations>

5.1. Meteorological Monitoring

An onsite weather station is located at Dunmore which collects a range on meteorological parameters. The location of the weather station is shown in Figure 6 in Appendix A.

There is no prescribed impact assessment criteria and meteorological monitoring is used to provide background information for management of the site. A detailed summary of the FY19 and historical rainfall data can be found in in Appendix A.

5.1.1. Meteorological Monitoring Long Term Analysis and Trends

The highest rainfall was experienced in late spring and early summer which is line with historical site and regional averages. Overall FY19 was below site and regional averages which is consistent with other regional areas in southern NSW.

Prevailing winds were from the WSW during the majority of the year with the exception of the summer months. In summer the prevailing wind tended to be from the N or NNE. There was a lower percentage of calm conditions with no/low wind in winter. This is consistent with historical trends for the site and the region generally.

5.1.2. Meteorological Monitoring Summary and Opportunity for Improvement

A new weather system is being constructed as part of the transition to real time air quality monitoring. An app system will run alongside this system which will allow the integration of wind data to the monitors. This app system will allow more intuitive access to monitoring data to inform operations.

5.2. Air Quality

Two methods of monitoring air quality is used at Dunmore Quarry. Deposited dust gauges are used to measure deposited dust every 30 days (+/- 2 days). A High Volume Air Sampler (HVAS) is used to measure the fine particulate matter under 10 microns (PM10) every 6 days. All monitoring points were below the required assessment criteria for deposited dust, PM10 and TSP for the reporting period.

5.2.1. Deposited Dust Monitoring Assessment Criteria

Relevant deposited dust impact assessment criteria applies to a residence on privately owned land. Monitoring points 1, 2 and 4 are not located in direct vicinity of residences. It is important to note that the assessment criteria refers to an annual averaging period (i.e. a monthly average over the last 12 months). Impact assessment criteria is shown in Table 9 below.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

Table 9 Deposited Dust Impact Assessment Criteria

| Pollutant | Averaging Period | Criterion | |
|--|------------------|---------------------------------------|---|
| Deposited dust ^c | Annual | 2g/m ² /month ^b | 4g/m ² /month ^{a,d} |
| <ul style="list-style-type: none"> a Cumulative impacts (i.e. increases in concentration due to development plus all other sources) b Incremental impact (i.e. increases in concentration alone, with zero allowable exceedences of criteria over the life of the development. c Deposited dust is defined as insoluble solids d Excludes extraordinary events such as bushfires, prescribed burning, dust storms, sea fog, fire incidents or any other activity as agreed by the Secretary. | | | |

5.2.2. Deposited Dust Monitoring FY19 Performance Review

All monitoring points were below the required assessment criteria or dust measured as insoluble solids over the annual averaging period. All sites also were below 4g/m²/month for ash fraction which excludes the organic (combustible) component of the sample such as vegetation, bird droppings and insects. These organic contaminants within the sample are typically representative of the surrounding wetlands and farmland which the monitors are located within.

A summary of results for each monitoring location is shown in Table 7 below. A monthly breakdown of each site and summary graphs is located in Appendix B.

Table 10 FY19 Deposited Dust Monitoring Summary

| Month | Site 1 grams/m ² /month | | Site 2 grams/m ² /month | | Site 3 grams/m ² /month | | Site 4 grams/m ² /month | |
|----------------------|---------------------------------------|------|---------------------------------------|------|---------------------------------------|------|---------------------------------------|------|
| | Insoluble Solids | Ash |
| 18/19 Average | 3.05 | 1.84 | 2.95 | 1.92 | 3.66 | 2.01 | 2.81 | 1.59 |

A state wide dust storm was experienced regionally from 12-14th of February which caused elevated readings for February at most sites. Despite this, annual averages were still below impact assessment criteria. Images of the dust storm is shown in Figure 30 and 31 in Appendix B.

5.2.3. Particulate Monitoring Impact Assessment Criteria

The impact assessment criteria for Particulate Monitoring is shown below in Table 11.

Table 11 Particulate Matter Impact Assessment Criteria

| Pollutant | Averaging Period | Criterion |
|--|------------------|-------------------------------------|
| PM10 | Annual | ^{a,d} 25 µg/m ³ |
| PM10 | 24 hour | ^b 50 µg/m ³ |
| TSP | Annual | ^{a,d} 90 µg/m ³ |
| PM2.5* | Annual | ^{a,d} 8 µg/m ³ |
| <ul style="list-style-type: none"> a Cumulative impacts (i.e. increases in concentration due to development plus all other sources) b Incremental impact (i.e. increases in concentration alone, with zero allowable exceedences of criteria over the life of the development. | | |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

- *d Excludes extraordinary events such as bushfires, prescribed burning, dust storms, sea fog, fire incidents or any other activity as agreed by the Secretary.*

*Please note that the requirement to monitor PM2.5 was inserted as a condition post MOD 9 approval. The requirement to monitor in real-time was also inserted as a consent condition as part of MOD 9. The new AQMP was approved in May 2019 and the installation of real-time monitors capable of measuring TSP, PM10 and PM2.5 is due to occur in the next reporting period.

5.2.4. Particulate Matter FY19 Performance Review

TSP concentrations are not measured in the vicinity of the quarry, however annual average TSP concentrations can be derived based on typical ratios of PM10/TSP. Rural areas (such as the Dunmore Quarry), typically experience a PM10/TSP ratio of 0.4. This ratio has been applied to the annual average PM10 concentrations to derive a representative TSP background concentration in $\mu\text{g}/\text{m}^3$. This methodology is in-line with the method used by Ramboll in the Mod 9 Environmental Assessment.

The annual average PM10 measurement for the reporting period from monitoring point 5 was below impact assessment criteria for $25 \mu\text{g}/\text{m}^3$ for PM10 and $90 \mu\text{g}/\text{m}^3$. PM10 measurements were also similar to Albion Park annual averages. Summary of FY19 particulate matter is shown below in Table 12.

Table 12 FY 19 Particulate Matter Summary

| Pollutant | Dunmore Quarry FY19 Average ($\mu\text{g}/\text{m}^3$) | Albion Park FY19 Average | Dunmore Quarry Long Term Average ($\mu\text{g}/\text{m}^3$) |
|-------------|--|--------------------------|---|
| PM10 | 18.57 | 17.8 | 12.95 |
| Derived TSP | 46.43 | 44.5 | 32.38 |

There was one (1) reading above short term PM criteria recorded at the monitoring point. On 1/02/19 a reading recorded at the HVAS located at monitoring point 5 had a reading of $81.47 \mu\text{g}/\text{m}^3$. An investigation was undertaken of the operations and ambient conditions experienced on 1 February. Findings were sent to DPIE and EPA within 7 days of receiving these results. To summarise:

- Alerts were received on February 1 indicating that regional air quality exceeded PM10 national standards the day previously.
- The plant was shut down for scheduled maintenance all day on February 1 2019. No production occurred during this time. Haul road and water cart operation continued as per normal operations.
- Weather data recorded on the Dunmore Quarry Weather Station indicate that the prevailing wind was from the S/SSW which were not from the direction of the quarry.

As a result of these investigations it has been determined that the elevated measurements of PM10 at Monitoring point 5 are not due quarry operations but are reflective of the regionally high ambient PM10 levels above the $50 \mu\text{g}/\text{m}^3$ which led to the elevated reading on the HVAS. This was investigation was reported to DPIE and EPA as per S5.C7.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

Figures 33 and 34 in Appendix B shows the regional alerts sent out from the OEH demonstrating the high PM10 values experienced throughout the region on 31/1/19 and 1/2/19.

Summary Tables and graphs showing the PM10 measurements throughout the reporting period can be found in Appendix B.

5.2.5. Air Quality Long Term Analysis and Assessment

The site has been collecting deposited dust data since 2002. A graph of long term trends can be found in Figure 25 in Appendix B and shows that typically deposited dust has typically decreased over time.

A graph showing measured deposited dust vs production is presented in Figure 26-29 in Appendix B. Since the cladding of the primary crusher in 2010 there has been no correlation between production tonnes and measured deposited dust.

A general trend which has been observed is that typically measured deposited dust is higher in dry summer months than winter months which is to be expected. This trend is also confirmed with PM10 measurements and is generally reflective of regional conditions as a whole. Figure 35 in Appendix B shows a 90 day average which demonstrates clearly defined seasonal variations in PM10 measurements.

The seasonal fluctuation in PM10 measurements shows a clear trend that PM10 values are typically higher in the dry periods in summer and are lower in winter. This fluctuation is mirrored by Albion Park PM10 measurements available on the OEH website.

<https://www.environment.nsw.gov.au/AQMS/search.htm>

These trends indicate the measured PM10 and deposited dust values are typically influenced more from ambient local conditions than quarry operations.

5.2.6. Air Quality Summary and Opportunities for Improvement

New consent conditions were inserted as part of MOD 9 which requested the used of real time monitors to measure TSP, PM10 and PM2.5. After approval of the AQMP in May 2019, this system will be upgraded. As of time of writing (September) these machines have been purchased and the transition phase will begin during the next reporting period.

The transition to real-time monitors will allow a proactive approach to managing air quality based on real time data and management actions via a Trigger Action Response Plan (TARP). Management responses are outlined when real time data is trending upwards. The new monitoring methodology will focus more towards monitoring particulates rather than deposited dust. The deposited dust monitoring program will be discontinued after the transition to real time monitoring is complete as per the approved AQMP. Details of the updated air quality management plan and the new monitoring system is available on the Dunmore website.

5.3. Noise

Annual Noise Monitoring is undertaken annually in winter to determine quarry contribution to noise to private residence. The current reporting period was the first instance where the new monitoring points were assessed post MOD 9 approval. Monitoring results demonstrated compliance with prescribed assessment criteria during all monitored time periods.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5.3.1. Noise Impact Assessment Criteria

S4C4 outlines the relevant noise assessment criteria to be adopted for the annual monitoring in Table 13 below.

Table 13 Noise Limits for Dunmore Quarry

| Receiver Location | Noise Limits dB (A) | | | | | |
|---------------------------------|-------------------------------|---------|-------|----------|-----------------|----------|
| | LAeq (15 minute) | | | | LAeq (1 minute) | |
| | Day | Evening | Night | Shoulder | Night | Shoulder |
| Location K Stocker Residence | 49 | 44 | 38 | 47 | 48 | 55 |
| Location O Dunmore Lakes | 49 | 44 | 38 | 47 | 48 | 55 |
| Location J Creagan Residence | Negotiated Agreement in Place | | | | | |
| Location AA | 38 | 38 | 38 | 38 | 45 | 45 |
| Locations AB and T | 36 | 36 | 36 | 36 | | |
| Location D,F,G and Z | 40 | 40 | 40 | 40 | | |
| Location S | 37 | 37 | 37 | 37 | | |
| Other privately owned residence | 35 | 35 | 35 | 35 | | |

5.3.2. Noise Performance FY19 Review

A summary of the attended noise monitoring results against the modelled MOD 9 quarry operations is shown below in Table 14.

Table 14 Summary of FY19 Noise Monitoring Results.

| Post Modification 9 Noise Monitoring Results NM1 (representative of resident K and O) | | | | |
|---|----------------|----------------|------------------|---------------|
| | Day | Evening | Morning Shoulder | |
| Noise | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(1min) |
| Limit | 49 | 44 | 47 | 55 |
| Predicted | 35 | 35 | 35 | |
| 2018 | 40 | 40 | 40 | 50 |
| Post Modification 9 Noise Monitoring Results NM2 (representative of resident S) | | | | |
| | Day | Evening | Morning Shoulder | |
| | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(1min) |
| Limit | 37 | 37 | 37 | 45 |
| Predicted | 35 | 35 | 35 | |
| 2018 | 30 | 30 | 30 | 32 |
| Post Modification 9 Noise Monitoring Results NM3 (representative of resident T) | | | | |
| | Day | Evening | Morning Shoulder | |
| | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(1min) |
| Limit | 36 | 36 | 36 | 45 |
| Predicted | 35 | 35 | 35 | |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

| | | | | |
|--|----------------|----------------|------------------|---------------|
| 2018 | 35 | 35 | 35 | 40 |
| Post Modification 9 Noise Monitoring Results NM4 (representative of resident G,D,Z) | | | | |
| | Day | Evening | Morning Shoulder | |
| | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(1min) |
| Limit | 40 | 40 | 40 | 45 |
| Predicted | 35 | 35 | 35 | |
| 2018 | 30 | 30 | 30 | 30 |
| Post Modification 9 Noise Monitoring Results NM1 (representative of resident F, AA,AB) | | | | |
| | Day | Evening | Morning Shoulder | |
| | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(15min) | dB LAeq(1min) |
| Limit | 40 | 40 | 40 | 45 |
| Predicted | 35 | 35 | 35 | |
| 2018 | 30 | 30 | 30 | 30 |

Note that follow up monitoring was undertaken at NM3 due to temperature inversion condition outside of assessment criteria during the initial round of monitoring.

5.3.3. Noise Long Term Analysis and Assessment

It is not possible to compare long term values for the assessed locations as the current reporting period was the first year in which these monitoring points were operation with the exception of NM1 which corresponds to the previous monitoring point Location K.

Results were compared against MOD 9 Dunmore Quarry noise contribution modelling results which shows noise monitoring results were generally within the predicted modelled results with the exception of Location K.

Location K is located in close proximity to Boral owned operation at Dunmore Sand and Soil and Dunmore Concrete Batching Plant so it is expected that measured noise levels are above modelled MOD 9 Dunmore Quarry contributions. 2018 results were still within relevant noise limits and were lower than historical averages. A summary table of noise monitoring results at Location K is shown in Table 30 in Appendix C

5.3.4. Noise Summary and Opportunities for Improvement

Improvements to the weather station are schedule in as part of the updates to the air quality monitoring network. This will allow access to real-time weather data which will assist site management to more efficiently identify and react to adverse meteorological condition such as inversions which may amplify any generated noise.

5.4. Blasting

S4C16 and S4.C17 outline the blast monitoring parameters which are assessed at the nearest receiver at the Benny Residence. Monitoring at the Benny residence indicated compliance with all relevant blast parameters during the reporting period. Monitoring Points are shown in Figure 37 I Appendix D.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5.4.1. Blasting Impact Assessment Criteria

S4C16 and S4.C17 outline the blast monitoring parameters which are assessed at the nearest receiver at the Benny Residence. These parameters are reproduced below in Table 15.

Table 15 Blasting Limits Dunmore Quarry

| Airblast Overpressure | Allowable exceedances |
|-----------------------|---|
| 120 ((dB(Lin Peak)) | 0 (absolute limit) |
| 115 ((dB(Lin Peak)) | 5% of the total number of blasts over a period of 12 months |
| Ground Vibration | Allowable exceedances |
| 10mm/s | 0 (absolute limit) |
| 5mm/s | 5% of the total number of blasts over a period of 12 months |

In addition, the approved Blast Management Plan outlines monitoring which will be undertaken to preserve the heritage value of the old flour mill at the MacParlands residence. The following blast parameters were adopted.

Table 16 Blast Limits at MacParland Residence

| Airblast Overpressure | Allowable exceedances |
|-----------------------|---|
| 130 ((dB(Lin Peak)) | 5% of the total number of blasts over a period of 12 months |
| Ground Vibration | Allowable exceedances |
| 30mm/s | 5% of the total number of blasts over a period of 12 months |

5.4.2. Blasting Performance Review

All blasts within the reporting period were compliant with criteria described in Table 15. Figure 2 and 3 shows a summary of the FY19 blast monitoring results for Airblast overpressure and ground vibration respectively.

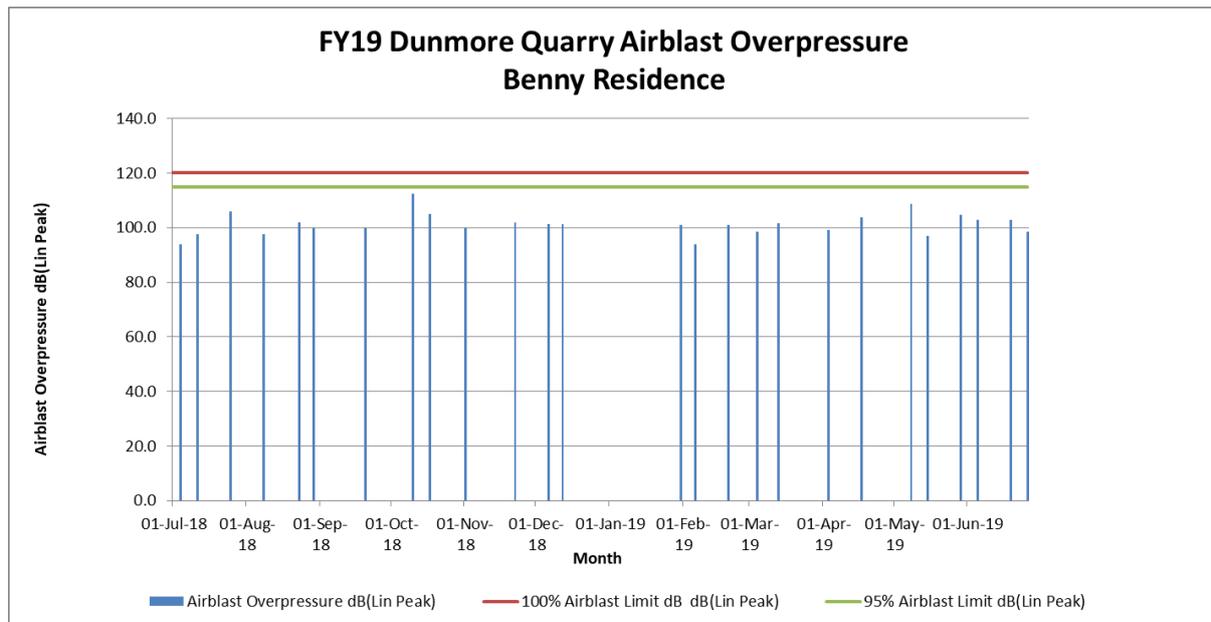

Figure 2 FY19 Airblast Overpressure Benny Residence

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

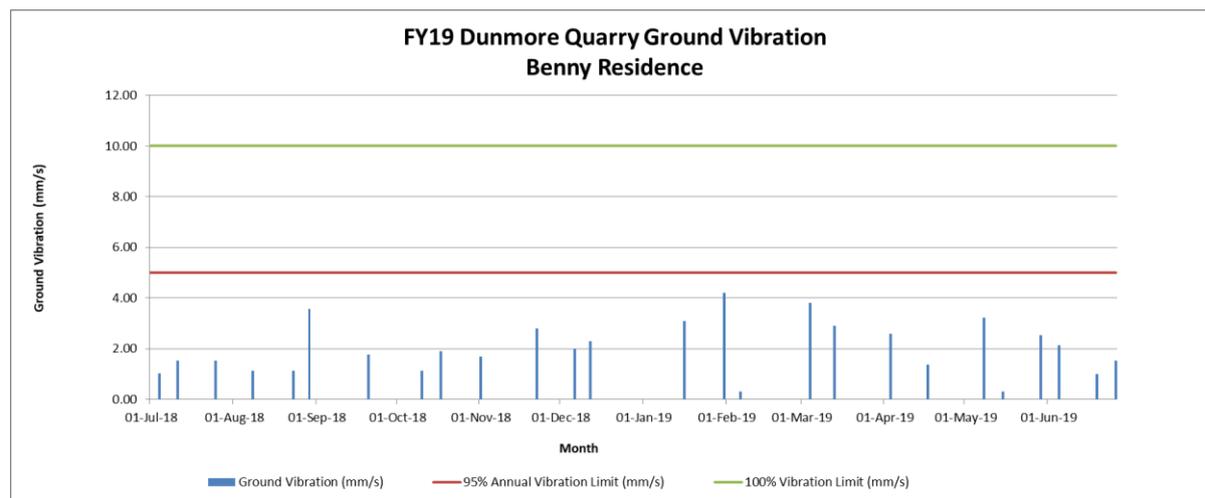

Figure 3 FY19 Ground Vibration Benny Residence

5.4.3. Blast Long Term Analysis and Assessment

Figure 38 and 39 in Appendix D show historical monitoring results and associated trends. It is important to note that the compliance monitoring point changed from the MacParland monitoring point to the Benny Monitoring point in February 2018 in the last reporting period. The MacParland property was acquired by Boral in September 2016.

There has been a slight upward trend of blast monitoring results since 2005 which is to be expected as operations moved west-ward towards the former MacParland monitor. In the last reporting period blast monitoring results were below what has been typically measured in previous years.

5.4.4. Blast Summary and Opportunities for Improvement

Focus on the next 12 months will centre on consolidating actions detailed in the updated BMP. A dilapidation report has been scheduled in at the MacParland property to ensure heritage values are conserved as per the approved Blast Management Plan.

5.5. Surface Water Management

An updated Water Management Plan was submitted to the department in the last reporting period but has yet to be approved. As a result, the monitoring and operations for the FY19 follow procedures outlined in the Arcadis Dunmore Quarry Water Management Plan (2016).

During normal operations, the Lower Dam is kept offline to Rocklow Creek however in the case of high rainfall there is potential for floodwaters to back up around the narrow bend of the creek and inundate the Lower Dam, causing it to fill and create a mixing zone with waters from Lower Dam, compromising its storage capacity. Upgrades to the water management plan detail a range of improvements to prevent such a phenomenon as described in Section 5.5.5.

During site discharge events, water quality monitoring results downstream of the Lower Dam at Rocklow Creek (GS-3) was below limits for TSS. Any elevated TSS measurements were restricted to the immediate vicinity of the spillway (EPL7) and floodwater mixing zone (GS-2).

Figure 40 in Appendix E outlines the monitoring points for the most recently approved WMP.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5.5.1. Water Quality Impact Assessment Criteria

S4.C28 defers discharge limits to the limits imposed by EPL77 which states that the site will comply with discharge limits from condition L2.4 and Section 120 of the POEO Act. EPL77 describes discharge limits at the licenced discharge point for controlled discharge at the site at via the bio-filtration swale at EPL6. Total Suspended Solids must not exceed 50mg/L at this point. A second discharge point is nominated in EPL77 for uncontrolled discharge at the spillway at the Lower Dam at EPL7.

Monthly monitoring is undertaken at the Lower Dam at GS-1, GS-2 and GS-3 at Rocklow Creek to determine ambient conditions upstream, in the immediate vicinity of the Lower Dam spillway and downstream respectively.

Monitoring is also undertaken daily during any discharge event via either the licenced discharge mechanism at EPL6 or uncontrolled discharge at EPL7 as well as the upstream and downstream points at Rocklow Creek to determine if any impacts to water quality has occurred.

5.5.2. Surface Water Performance Review

Lower Dam water quality at EPL 8 is shown below in Table 17.

Table 17 Lower Dam Monthly Monitoring Results

| Year / Month | pH | TSS (mg/L) | Turbidity (NTU) | Conductivity (uS/cm) | Oil and Grease |
|-------------------|-----|------------|-----------------|----------------------|----------------|
| Jul-18 | 8.7 | 32 | 58.4 | 647 | Not Visible |
| Aug-18 | 7.7 | 8 | 24.5 | 583 | Not Visible |
| Sep-18 | 8 | 15 | 29.6 | 581 | Not Visible |
| Oct-18 | 8.2 | 32 | 40.3 | 719 | Not Visible |
| Nov-18 | 8.4 | 49 | 83.8 | 718 | Not Visible |
| Dec-18 | 8.6 | 23 | 54.1 | 704 | Not Visible |
| Jan-19 | 8.4 | 33 | 40 | 653 | Not Visible |
| Feb-19 | 8.1 | 46 | 54.8 | 839 | Not Visible |
| Mar-19 | 8 | 24 | 31.4 | 706 | Not Visible |
| Apr-19 | 8.2 | 23 | 24 | 690 | Not Visible |
| May-19 | 8.2 | 200 | 257 | 695 | Not Visible |
| Jun-19 | 8.7 | 26 | 32.6 | 724 | Not Visible |
| 2018-2019 Average | 8.3 | 42.6 | 60.9 | 688.3 | >5 |

Typically water quality parameters were within TSS discharge limits within the Lower Dam for the reporting period with the exception of the May monitoring period which was undertaken on 4/6/19 during a period of intense rain. It is important to note that discharge limits do not apply to the Lower Dam. During typical operations the Lower Dam is offline to Rocklow Creek.

No controlled discharges via the bio-filtration swale at EPL6 were initiated during the reporting period. Typically the bio-filtration swale at EPL6 is not utilised as a discharge mechanism as water infiltrates back into the Lower Dam, reducing the effectiveness of the bio-filtration swale as a discharge mechanism. This issue has been highlighted in the updated water management plan and this discharge point is proposed to be decommissioned with the site not undertaking controlled discharge out of EPL6.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

A summary table of the associated monitoring points upstream and downstream of the Lower Dam is shown below in Table 18-20.

Table 18 Upstream Rocklow Creek Monthly Water Quality

| Average | | 7.3 | 18.4 | 16.2 | 3241 | NV |

Monthly monitoring results at Rocklow Creek indicate the following:

- Ambient conditions upstream of the Lower Dam at GS-1 are occasionally elevated compared to the WQOs and discharge limits. This is likely due to the area being utilised for active cattle grazing. Cattle tend to stir up water during grazing and are often observed within Rocklow Creek during monthly sampling events.
- Ambient conditions in the vicinity of the mixing zone at GS-2 are typically within discharge limits with the exception of high rainfall events when floodwater are present.
- Ambient conditions at GS-3 at downstream Rocklow Creek are generally within discharge parameters. This location is sometimes dry, affected by saline tidal inflow and impacted by cattle grazing. During dry periods water level tends to be quite low. Cattle tend to stir up water during grazing and are often observed within Rocklow Creek during monthly sampling events.

Overall there were three (3) rainfall events which led to discharge from the Lower Dam via the spillway at EPL 7 on five (5) days. Two (2) of these rainfall events were outside the 95th percentile 5 day rainfall design capacity of the Lower Dam (90.7mm). Daily monitoring results associated with these events is summarised in the Table 21 below.

Table 21 Discharge Monitoring Summary

| Rainfall | Date | pH | | | | TSS(mg/L) | | | | Turbidity(NTU) | | | |
|----------|-----------|-----|------|-----|-----|-----------|------|-----|-----|----------------|------|------|------|
| | | GS1 | EPL7 | GS2 | GS3 | GS1 | EPL7 | GS2 | GS3 | GS1 | EPL7 | GS2 | GS3 |
| 104.0 | 6/1/19 | 6.7 | 7.7 | 7.4 | 7.3 | 39 | 101 | 34 | 16 | 18.1 | 207 | 105 | 21.8 |
| 109.0 | 18/3/2019 | 6.9 | 7.8 | 7.0 | 7.0 | 38 | 28 | 30 | 24 | 21.5 | 100 | 32.5 | 19.5 |
| 109.0 | 19/3/2019 | 6.6 | 8.1 | 6.9 | 7.4 | 6 | 56 | 37 | 11 | 6.1 | 99.6 | 54.2 | 8.6 |
| 73.5 | 4/6/2019 | 7.4 | 8.2 | 8.1 | 7.2 | 94 | 141 | 136 | 24 | 26.1 | 226 | 144 | 13.6 |
| 73.5 | 5/6/2019 | 7.5 | 8.2 | 8.0 | 7.7 | 7 | 98 | 87 | 32 | 2.2 | 154 | 132 | 23.7 |

The discharge water quality monitoring results can be summarised below:

- TSS water quality parameters are occasionally elevated upstream of the Lower Dam at GS-1. This is likely due to the area being utilised for cattle grazing. Cattle tend to stir up water during grazing and are often observed within Rocklow Creek during sampling events.
- Occasionally TSS is elevated above discharge limits for TSS in the immediate vicinity of the spillway (EPL7) and Rocklow Creek mixing zone (GS-2) due to the inundation of floodwaters of Rocklow Creek.
- TSS water quality parameters met compliance limits downstream at Rocklow Creek at GS-3 in all instances of monitoring during discharge events from the Lower Dam during the reporting period.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

- The monitoring results during high rainfall events and overtop events indicated that impacts are limited to the discharge mixing zone in the immediate vicinity of the spillway, with no impacts further downstream at Rocklow Creek due to suspended solids and minimal turbidity impacts. Average turbidity during rain events is still comparable with ambient averages from monthly monitoring.
- Downstream of the Lower Dam and the vicinity of the Lower Dam is surrounded by wetlands which remove any localised suspended solids rapidly before they impact Rocklow Creek downstream at GS-3.

There was one instance where the Lower Dam was unable to hold up to the 95th percentile 5 day rainfall event of 90.7mm as outlined in S4.C32. A notification was provided to the EPA within 7 days of the event and investigation of the overtop event on the 4th and 5th of June. An investigation report was provided once monitoring results were available.

Floodwaters from Rocklow Creek had risen up over the spillway and into the Lower Dam, which in turn, overflowed and spilled over. The floodwaters of Rocklow Creek then formed a mixing zone with the waters from the Lower Dam. Turbid water was visible both downstream and upstream of the spillway near the mixing zone at GS-2. Improvements to the WMP submitted to the department address methods to reduce instances of floodwater from Rocklow Creek inundating the Lower Dam, compromising its storage capacity.

A summary of the investigation report was submitted to the EPA and at time of writing Boral is still awaiting feedback from the EPA.

5.5.3. Water Balance

The updated WMP outlined a range of water balance scenarios based on different climate conditions. The dry year scenarios (10th percentile 791mm rainfall) best reflects rainfall for the FY19 period (which was 890mm). As a result the process water use was modelled to be 188ML for the reporting period. Licenced surface water take from WAL#25152 is 227ML. As such FY19 water balance results determine compliance with water take licence requirements.

The majority of surface water runoff from the quarry is captured in the site water management dams. Captured surface water runoff is either used as process water within the quarry operation, lost to evaporation or seepage, or discharged to receiving waters.

The capture of surface water runoff in the water management dams is considered to be excluded works under Water Management (General) Regulation 2011, Schedule 1, item 3 (dams solely for the capture, containment or recirculation of drainage). Accordingly, no WALs are required for the capture of surface water in the Middle Dam and Croome Pits.

Historically, all process water has been extracted from Lower Dam with most of the water expected to have been drawn from the Rocklow Creek alluvium via groundwater ingress into the dam.

5.5.4. Surface Water Long Term Analysis and Assessment

Figure 41-44 in Appendix E shows historical averages and trends for Lower Dam Water Quality Monitoring.

Lower Dam water quality monitoring was consistent with the previous period and was generally consistent the annual averages in the last 4 years. Historical trends of turbidity and TSS are generally

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

increasing due to the higher annual averages in 2012-13 and 2013-14 where multiple high rainfall floods occurred within the Illawarra. Typically in wetter years Lower Dam turbidity and TSS is on average which is to be expected as its purpose is a sediment capture dam.

5.5.5. Surface Water and Opportunities for Improvement

A new water management system was devised as part of the MOD 9 Surface Water Assessment where a number of improvements were proposed. It is a requirement of S4C35A that the Lower Dam is not altered until approval of the Lower Dam Transition Plan is obtained. The improvements to the water management system outlined in the updated WMP will reduce the instances where Rocklow Creek inundates the Lower Dam causing it to fill up. A summary of these improvements is reproduced in Table 22 below.

It is expected that feedback will be provided during the next reporting period and pending approval these works will be undertaken.

Table 22 Proposed Water Management Improvements in Updated WMP

| Proposed Modification | Outcome |
|---|---|
| Relocate spillway to south-east side of the dam where Rocklow Creek levels are expected to be lower during large runoff events. Relocate primary sedimentation chamber to western end of dam. Raise embankment at existing spillway location from 2.8 to 4.0 m AHD. | <ul style="list-style-type: none"> Significantly reduce the frequency of uncontrolled inflows from Rocklow Creek inundating the Lower Dam. Improve water treatment function of Lower Dam during Rocklow Creek flood events. Inflows will occur at the opposite end of the dam to outflows, resulting in longer residence time and improved sediment treatment function. Provide vehicle access to primary sedimentation chamber to allow for sediment removal as required |
| Extend the dam footprint to the east by approximately 1,600m ² and excavate to 2.0 m AHD. | <ul style="list-style-type: none"> Provide an additional 1.1 ML of storage above 2.0 m AHD. Establish a macrophyte zone near the dam outlet. |
| The relocated spillway will have an invert level of 3.1 m AHD1, which will be 300 mm higher than the existing level (2.8 m AHD). | <ul style="list-style-type: none"> Reduce the frequency of Rocklow Creek floodwaters inundating the Lower Dam. Provide an additional 2.0 ML of storage above 2.0 m AHD. |
| Establish macrophyte zone within extended dam footprint area. | <ul style="list-style-type: none"> Provide beneficial water quality treatment during significant rainfall (discharge) events. |

Notes: 1. The spillway level of 3.1 m AHD represents the highest permanent water level proposed for the Lower Dam.

A numbering of new metering regulations will be rolled out by NRAR during the next reporting period which will require upgrades to the metering system utilised at the quarry.

5.6. Groundwater Management

As a result of the Dunmore Quarry Western Expansion, EMM Consulting Pty Ltd has published an annual groundwater monitoring report using the established down gradient bores at Dunmore Sand and Soil (DG-31, DG-59 and BH-F and 3 established up gradient bores at Dunmore Quarry (GW-1, GW-2 and GW-3).

Location of Groundwater monitoring locations and the final report is contained within Appendix F

The monitoring bores are located up hydraulic gradient from current quarrying activities and are therefore considered representative of baseline conditions (both water levels and quality).

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

Groundwater monitoring for the up gradient bores includes six-hourly groundwater level measurements and six monthly groundwater sampling events.

5.6.1. Groundwater Impact Assessment

Groundwater impacts relating to quality and water levels downgradient are assessed in relation to the up-gradient (baseline) conditions located in bores GW-1, GW-2 and GW-3 and against the site conceptual model which was formulated as part of the MOD 9 Croome West Expansion.

5.6.2. Groundwater FY19 Performance Review

The main findings of the monitoring results within the FY19 reporting period are summarised below:

Groundwater levels are recorded every six-hours allowing water level trends to be identified in the alluvium and the Bumbo Latite. Six monthly sampling of water quality at all sites also established useful trends.

The main findings for the 2018/2019 monitoring year regarding water levels are:

- Groundwater levels in the alluvium at the DSS sites show a direct response to rainfall and minor tidal influences; and
- Groundwater levels in the Bumbo Latite monitoring bores vary spatially between the three monitoring bores. Groundwater levels are the highest at monitoring bore GW2 (128 mAHD) and lower at monitoring bores GW1 (between 100 mAHD and 110 mAHD) and GW3 (105 mAHD). Groundwater levels are steady after a slight decline at GW1 and GW3 corresponding with continued below average rainfall. GW2 shows little response to rainfall.

The main findings for this monitoring year regarding water quality are:

- Groundwater quality at the alluvial monitoring sites was consistent with historical data, except DG-31 showing chlorine anions dominant over bicarbonate in this monitoring year. The newly monitored DG-17 has elevated phosphorus in comparison to the rest of the alluvial sites; and
- Groundwater quality in the Bumbo Latite is marginal to brackish, of near neutral to alkaline pH. Groundwater in the latite is dominated by sodium and bicarbonate and is elevated in silica reflecting the mineralogy of the host rock. Dissolved metals and nutrients are detected at overall low concentrations. Groundwater quality remains constant and was comparable to results from the previous monitoring years.

The results for the 2018/19 monitoring year are consistent with the conceptual model for the project.

5.6.3. Groundwater Long Term Analysis and Assessment

The results for the FY19 monitoring are in agreement with the conceptual model for the project. This data will inform the updated Water Management Plan for Mod 9 operations which will include a groundwater monitoring program as per Schedule 4 Condition 44.

5.6.4. Groundwater Opportunities for improvement

Another groundwater bore will be identified to replace DG59 which was demolished as part of dredging operations at the adjacent DLSP.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5.7. Flora and Fauna Management and Rehabilitation

Most areas of the site are currently operational and as such rehabilitation is not able to commence on the majority of areas within the quarry until the completion of extraction activities. When practical, progressive rehabilitation of the site will be undertaken in conjunction with on-going quarrying works. Rehabilitation activities undertaken to date have been in accordance with the updated Flora and Fauna Management by EMM (2019) and Rehabilitation Management Plan prepared by Arcadis (2016).

There are three (3) designated conservation areas for Dunmore Quarry as shown in Figure 4 below.

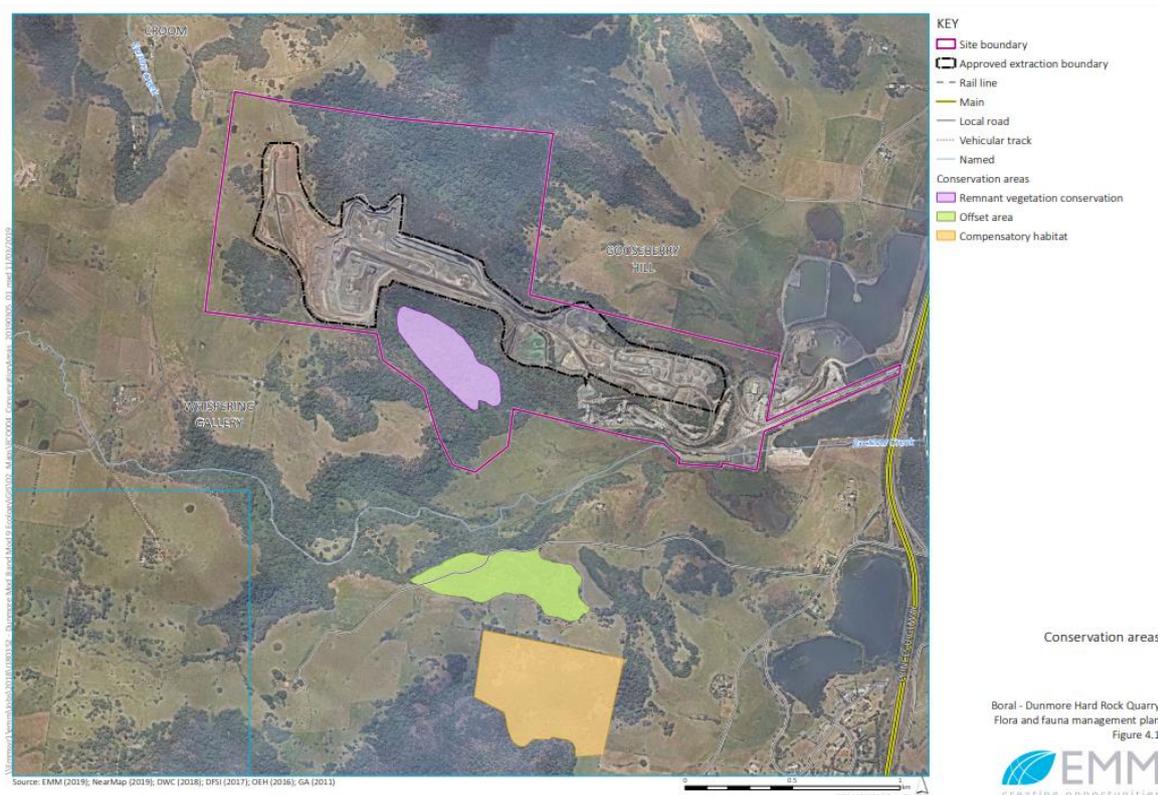

Figure 4 Location of Dunmore Quarry Conservation Areas

These are the Compensatory Habitat Area (CHA), Remnant Vegetation Conservation Area (RCVA) and Offset Area (OA). Works in the last reporting period focussed on the CHA and OA.

In the last 12 months rehabilitation within the quarry itself has continued on the Croome West amenity bund. Hydro-seeding took place in the northern section of the bund in November 2018 and April 2019 with more infill seeding to occur in the next reporting period.

5.7.1. Rehabilitation Assessment Criteria

During the reporting period the FFMP was being updated by Boral and reviewed by OEH/DPIE. Rehabilitation Assessment criteria continued under the recommendations of the vegetation assessment undertaken in 2017. A summary of this criteria is summarised below:

- Protect and enhance the remnants of the existing vegetation communities: Illawarra Dry Subtropical Rainforest, Illawarra Grassy Woodland and Melaleuca Armillaris Tall
- Shrubland

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

- To reduce the area of Boral Dunmore Quarry natural areas impacted by Noxious Weeds, WoNs and environmental invasive weeds.
- Treat significant woody weeds throughout establishing 10 – 15 year old revegetation areas to assist development and establishment
- To improve connectivity between local remnant bushland fragments through weed control activities, regeneration and planting
- Assist natural regeneration by removing significant weed species using bush regeneration techniques and methods
- Monitor works, progress and completing using visual based documentation

5.7.2. Rehabilitation Performance Review

A summary of the bushland regeneration works undertaken within the Offset Area and Compensatory Habitat Area is outlined in Bushland Restoration Project Final Report in Appendix G

5.7.3. Rehabilitation Long Term Analysis and Assessment

Summaries of progress against previous years' work is detailed in the vegetation condition assessment within Appendix G. To summarise;

- In the OA, dry conditions resulted in very little weed regrowth effectively breaking the seed cycle in previously worked areas. Secondary weed control reinforced the disruption of the weed seed cycle.
- Due to the dry spell there was little regeneration of native species although the rainforest zone show good recruitment within canopy areas.
- Primary weed control has been carried out within all fragments of the CHA and have now been linked in one continuous management areas.
- In the CHA, primary weed control has focused within the northwest of the site and will expand into further zones. Within worked areas photo-point monitoring showed a reduction of woody weeds in the mid stratum, ground and shrub layer.

5.7.4. Rehabilitation Summary and Opportunities for Improvement

Completion criteria was designed in the updates to the FFMP which was approved in June 2019. The next 12 months will focus on progress towards attaining the completion criteria for applicable areas.

The following completion criteria are outlined for the Compensatory Habitat Area:

- establishment of a dominant native canopy cover across the Compensatory Habitat Area, as per below:
 - midstory canopy cover of 50% for areas of Melaleuca Armillaris Tall Shrubland; and
 - overstory canopy cover of 15% for areas of Illawarra Lowlands Grassy Woodland;
- removal of woody weeds across the Compensatory Habitat Area; and
- reduction in exotic groundcover to less than 30% over five consecutive monitoring periods.
- Once these completion criteria have been met, no further management of this area is required under this FFMP and Conditions 46(a) and 49 are deemed to have been satisfied.

The following completion criteria are outlined for the Remnant Vegetation Conservation Area:

- maintenance of high-quality intact remnants, with no significant change in cover of native species;
- establishment of a dominant native canopy cover of 15% in the lower (south-eastern) portion of the Remnant Vegetation Conservation Area; and

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

- Establishment of a predominantly native (>50%) groundcover, with maintenance of this native groundcover over five consecutive monitoring periods.

Once these completion criteria have been met, no further management of this area is required under this FFMP, and Conditions 46(b) and 50 are deemed to have been satisfied.

There is no completion criteria set for the offset area as the area is managed via an in-perpetuity arrangement via a conservation agreement. A Conservation Agreement between the Minister administering the National Parks and Wildlife Act (1974) and Boral Resources for Dunmore Quarry was signed by NSW Minister for the Environment on February 2011. The NSW Minister for the Environment confirmed signing the Dunmore Quarry Conservation Agreement, and acknowledged that the Conservation Agreement satisfied condition 46A of DA 470-11-2003, for the long term security of the Offset Area.

For the bio-diversity offset strategy as part of MOD 8 and 9 operations Boral will pay into the BCT as per approved arrangements contained within the FFMP.

5.8. Heritage Conservation

Kelleher Nightingale Consulting Pty Ltd was engaged by Boral to undertake a detailed Aboriginal archaeological assessment and prepare an Aboriginal Cultural Heritage Assessment Report (CHAR) to inform the Modification 9 EA.

An Aboriginal Cultural Heritage Management Plan was subsequently prepared for the project, detailing the required Aboriginal heritage management and mitigation measures. The plan was prepared in consultation with OEH and Registered Aboriginal Parties in accordance with condition 64 of the Modification 9 consent (approved September 2017) and is available on the Boral Dunmore website.

The archaeological salvage program was completed in October 2017 (outside the current reporting period) in accordance with the MOD 9 conditions of approval, requirements of the AHMP and approved salvage methodology outlined in the CHAR.

Archaeological salvage excavation and mitigation for the impact of the Croome Farm Pit expansion project on Aboriginal heritage has been completed for Croome West AFT 1 (AHIMS 52-5-0851) and Croome West AFT 2 (AHIMS 52-5-0850). Archaeological excavation and mitigation was not required for Croome West AFT 3 (AHIMS 52-5-0849).

Boral is committed to effective consultation with the local Aboriginal community regarding their activities and Aboriginal cultural heritage values. Registered Aboriginal Parties have been consulted and provided with an opportunity to participate in the assessment and management of Aboriginal heritage values. Consultation with Registered Aboriginal Parties has followed OEH consultation requirements as applicable Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010 (DECCW 2010a). Registered Aboriginal stakeholders participated in the salvage excavations.

Specific management and mitigation measures to be implemented prior to development impact included salvage excavation of sites or areas of archaeological significance: Croome West AFT 1 (AHIMS 52-5-0851) (CW1); Croome West AFT 2 (AHIMS 52-5-0850) (CW2).

The salvage operations of these study areas has mitigated the identified Aboriginal heritage constraints prior to any pre-construction or construction activities which may harm Aboriginal objects at these site locations. A total of 1,188 artefacts were recovered during the salvage

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

excavation program undertaken in October 2017 (outside of this reporting period), with 76 m² excavated across the two sites.

A draft report has been completed in September 2018 by Kelleher Nightingale and management actions are summarised below:

In accordance with the AHMP, salvaged Aboriginal objects will be managed at a temporary storage location for analysis and reporting purposes and lodged for long term management with the Australian Museum. Deposition of the significant archaeological assemblage at the Australian Museum ensures ongoing access and appreciation of the artefact assemblage for current and future generations.

The short term management of excavated Aboriginal objects is as follows:

- Any Aboriginal objects that are removed from the land by actions authorised by the project approval, must be moved as soon as practicable to the temporary storage location (see below) for analysis, reporting and preparation for the long term management of the Aboriginal objects.
- The temporary storage location is: Kelleher Nightingale Consulting Pty Ltd, Level 10, 25 Bligh Street, Sydney NSW 2000.
- Any Aboriginal objects stored at the temporary storage location must not be further harmed, except in accordance with the conditions of the approval.

The long term management of excavated Aboriginal objects is as follows:

Once all analysis has been completed, recovered objects will be lodged with the Australian Museum in accordance with the Australian Museum Archaeological Collection Deposition Policy

For the next reporting period focus will be on consultation with relevant parties to finalise the draft salvage report and commence with the long term management actions detailed above. Once finalised the report will be published on the Boral Dunmore website Areas of new disturbance will continue to be monitored for any unexpected finds as per the ACHMP.

5.9. Waste Management

Boral is committed to continuing non-production waste management minimisation in accordance with the waste hierarchy, and minimising the amount of waste sent to landfill. To achieve this, all liquid and solid wastes are classified and sorted so they can be appropriately re-used or recycled. Waste is managed by appropriately licenced sub-contractors and entered into a waste tracking register.

5.9.1. Waste Minimisation

Boral is committed to ensuring its extraction and processing activities produces minimal waste rock material. Approximately 30% of the hard rock processed at Dunmore Quarry becomes material of less than 4mm in diameter, which is known as quarry fines. In the past, quarry fines were considered a product waste and stockpiled due to having no steady market, however the material is now used in manufactured sand (as opposed to natural sand) production. Dunmore Quarry transfers quarry fines to the Boral owned Dunmore Lakes Sand Project (DLSP) site for blending to produce manufactured sand.

During the reporting period, 36,000 tonnes of quarry fines was transferred to the adjacent DLSP site for manufactured sand production, backfilling and progressive rehabilitation.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

New recycling bins have been commissioned in high pedestrian areas outside the office to encourage the recycling of applicable waste.

5.9.2. Waste Tracking Register

A detailed breakdown of the waste collected on-site during the reporting period is shown below in Table 23. Yearly trends are shown in Table 24.

Table 23 FY19 Waste Tracking Register

| Month | General Waste (t) | Cardboard (t) | Commingle (t) | Timber (t) | Scrap Metal (t) | Oil Rag (t)*** | Oil Filter (t)** | Oil/Oily Waters (L) | Effluent (L) |
|--------------|-------------------|---------------|---------------|--------------|-----------------|----------------|------------------|---------------------|---------------|
| Jul-18 | 8.178 | 0 | 0.135 | 1.68 | 7.06 | 0.08 | 0.032 | 3800 | 15,500* |
| Aug-18 | 8.513 | 0.085 | 0.09 | 1.86 | 8.3 | 0 | 0 | 4100 | 15,500* |

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

5.9.3. Waste Tracking Opportunities for Improvement

More improvements have been planned for the next reporting period to encourage the use of recycling office waste by making more recycling bins available. Further work will continue with subcontractors to optimise the record keeping for waste collection.

5.10. Incident and Emergency Response Management

The following management actions were undertaken in regards to incident and emergency response.

- The Pollution Incident Response Management Plan was updated in October 2018. The current version is available online at.
- A Site Emergency Response Plan is available onsite in order to outline procedures in the case
- A Bushfire Management Plan was updated to inform protocols in place in the case of a fire on-site or in the surrounding areas.
- Vehicle pedestrian safety audit was undertaken during the reporting period. Car park and traffic areas were refurbished to remove pedestrian and vehicle interactions wherever possible.

5.11. Dangerous and Hazardous Goods Storage

Storage of dangerous goods and hazardous material have continued as per established operations. All dangerous goods and chemicals are handled and transported in accordance with the AS1940 and AS25956 and the Dangerous Goods Code and S4.C72.

6. Community

The Dunmore Quarry Community Consultative Committee (CCC) continues to serve as a valuable dialogue between Boral and the local community with valuable input and feedback being provided by the community regarding quarry operations and plans. The CCC is run as per S5.C6 and the Departments Community Consultative Committee Guidelines for State Significant Developments (2016).

Members include:

- An independent chairperson
- At least 2 representatives from Boral (typically the environmental co-ordinator and quarry manager)
- A member from Shellharbour City Council
- Three local community representatives

Members are informed of the environmental performance of the site, provided with an update on operations and given a chance to tour the site and ask questions they may have regarding the operation. CCC members have also been diligent in disseminating the information from the meetings to other interested community members in the local area. The minutes of each meeting is published in the Boral website.

<https://www.boral.com.au/locations/boral-dunmore-operations>

The CCC met twice during the FY19 reporting period (August 2018 and February 2019).

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

6.1.1. Environmental Complaint Management

Insert tables, no formal complaints received in the FY19 reporting period. Discuss trends from table which will be same as last year.

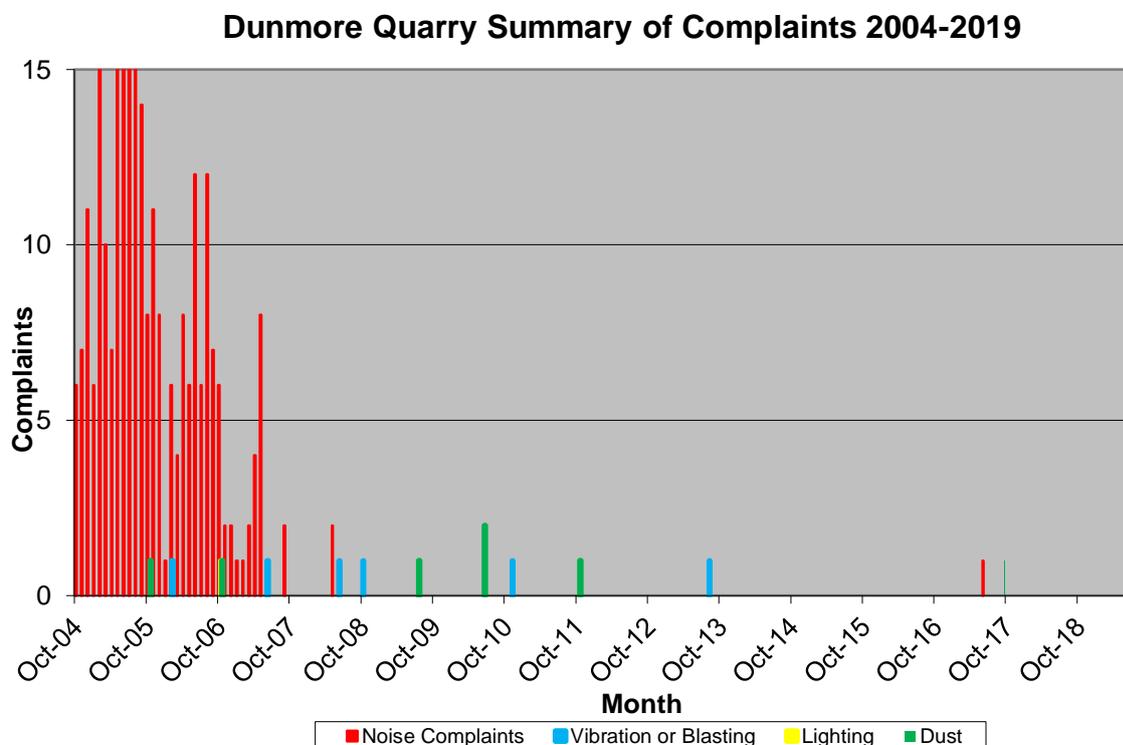

Figure 5 Dunmore Quarry Summary of Complaints

7. Summary of Regulatory Notifications

One regulatory notification was received during the last reporting period. A formal warning letter was received from the EPA on 16 April 2019 for a failure to comply with licence condition R4.1. This condition requires Boral to report to the EPA within 7 days of a monitoring blast exceeding the 95% limits for Airblast overpressure and/or ground vibration.

This was reported by Boral to the EPA in the 2017-18 Annual Return that on two occasions in February the 95 percentile limit was reached and were not reported within the 7 day timeframe.

Boral did not exceed these limits for more than 5% of the total blasts during the Annual Return reporting period.

In the formal warning letter, the EPA invited Boral to undertake a review of Condition R4.1 and whether it is considered appropriate or relevant to quarry operations. Boral exercised this option and met with the EPA on 4 June 2019 and requested a variation to remove this condition which was granted.

The requirement to report an exceedance of 100% limits for blasting to the EPA within 7 days is still in place.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

8. Activities to be completed by next reporting period.

The following actions are scheduled for completion in the next reporting period:

- 2020 Independent Audit
- Dilapidation report for flour mill at McParlands
- Weather station upgrades and Real time monitor installation
- Install cameras on Rocklow Road to deter illegal dumping.
- Continue rehabilitation and revegetation through offset areas
- Continue hydroseeding and maintenance of Croome West Bund
- Upgrades to lower dam (depending on direction/status of approval of WMP).
- Continue correspondence with DPE/EPA in reference to Lower Dam Transition Plan and Dam upgrades.
- Update metering to align with new regulations rolling out in December 2019.
- Finalise draft salvage report and publish on Dunmore website
- Commence with long term management strategies regarding storage of Aboriginal artefact as per ACHMP and finalised salvage report.

9. Conclusion

Dunmore Quarry has continued to focus on ensuring the environment and neighbouring community are not adversely impacted by quarry operations. Throughout this reporting period extraction and processing of quarry materials has remained consistent with previous years. During the reporting period MOD 11 was approved.

The 2018-19 revolved around enacting a number of major operational and procedural changes as part of the updated environment management plans for the MOD 9 Croome West Expansion. The next reporting period will contain a strong focus on maintaining regulatory compliance and optimising management actions established in the FY19 reporting period.

Boral Dunmore Quarry Annual Review

1 July 2018 - 30 June 2019

10. Appendix A Meteorological Monitoring

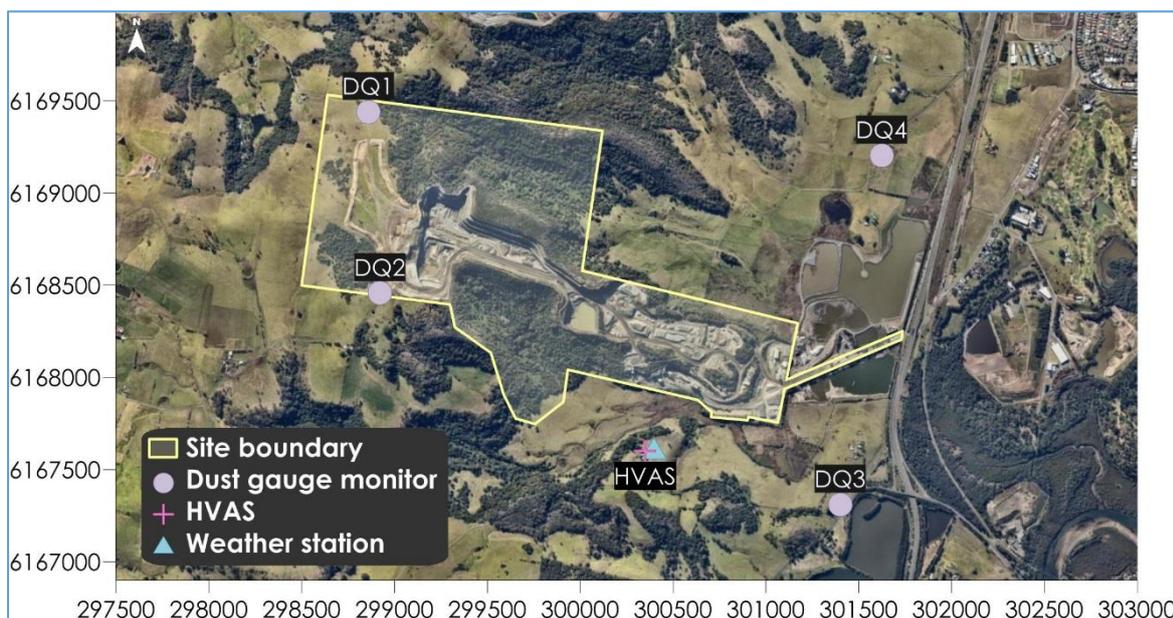

Figure 6 Weather Station Location

A monthly review of weather data is undertaken by the environmental co-ordinator. Important meteorological conditions assessed are rainfall, wind speed direction and atmospheric stability.

Rainfall data has been collected since FY2003. A summary of the rainfall measured from the Dunmore Quarry weather station is shown below in Table 25. Shown in red are the dates where rainfall was above the regional average.

Table 25 FY19 Monthly Rainfall Summary

| Month | Rainfall (mm) | | |
|-----------|---------------|--------------|------------------|
| | FY19 | Site Average | Regional Average |
| July | 6 | 54.0 | 49 |

The measured wind conditions experience on site for FY19 is shown below in Table 27. Monthly wind roses and seasonal wind roses are shown in Figure 7 to Figure 19.

Table 27 Summary of Monthly Wind Data

| Period | Mean Speed (m/s) | Peak Frequency (%) | Peak Direction | Percent Calm (%) |
|-----------|------------------|--------------------|----------------|------------------|
| July | 2.53 | 34.14 | WSW | 2.86 |
| August | 3.29 | 29.03 | WSW | 2.52 |
| September | 2.77 | 25.10 | WSW | 4.58 |
| October | 2.99 | 12.37 | WSW | 5.48 |
| November | 3.01 | 15.38 | WSW | 5.24 |
| December | 2.48 | 17.78 | WSW | 7.53 |
| January | 2.28 | 13.10 | NNE | 14.42 |
| February | 2.74 | 13.80 | N | 11.64 |
| March | 2.63 | 14.52 | WSW | 12.33 |
| April | 1.97 | 26.67 | WSW | 13.92 |
| May | 2.47 | 33.13 | WSW | 8.90 |
| June | 2.42 | 27.53 | SW | 12.85 |

Note: Wind measurements are taken over a 15 minute interval. Calm is defined as less than 0.3m/s.

1 July 2018 - 30 June 2019

13. Appendix D Blast Monitoring Information

| Monitoring Station | Entry Address | Station Description | GPS Coordinates |
|--------------------|---|---|---|
| A | Entry is from the end of Croome Road. | The monitoring position is located approx. 115m South East of the Benny residence on the Boral property line. | Latitude: -34.599995065 Longitude: 150.800225506 |
| B | Entry is from the rear gate of the quarry or alternately from Croome Vale Road. | The monitoring position is located approx. 85m North of the McParland residence on a solid rock floater. | Latitude: -34.60787 Longitude: 150.805488 |

Figure 37 Blast Monitoring Locations

The Benny residence is the monitoring point for the purposes of compliance. Updates to the blast monitoring plan have detailed that the MacParland monitoring point will continue to be monitored for the purposes of heritage conservation. Table 31 show the blast results for the Benny monitoring point for the reporting period. A historical summary and trend lines is presented in Figure 38 and 39. Blast monitoring results at the MacParland monitoring point is presented in Table 32.
